Medicaid/CHIP	78813	Positron emission tomography (PET) imaging; whole body	Yes	Interqual	None	1/1/2009	12/31/9999	
Medicaid/CHIP	78814	Positron emission tomography (PET) produces thin slice images of the body that can be reassembled into three-dimensional representations by detecting positron-emitting radionuclides from a radiopharmaceutical introduced into the body. These radionuclides must be produced in a cyclotron or generator that can bombard chemicals with neutrons to produce unstable, short- lived radioisotopes, such as carbon-11, nitrogen-13, and oxygen-15. These can be readily incorporated into common and important, biological body compounds for administration. Data from this kind of imaging yields metabolic or biochemical function information depending on the type of molecule tagged. In PET tumor imaging, information about the tumor's glucose and oxygen utilization is obtained, which reveals the tumor's behavior compared to normal tissue or benign tumors. Report 78811 for PET imaging of a limited area such as the chest alone; 78812 for imaging from the skull base to the mid-thigh; and 78813 for imaging of the whole body. Medicaid/CHIP	78815	Positron emission tomography (PET) produces thin slice images of the body that can be reassembled into three-dimensional representations by detecting positron-emitting radionuclides from a radiopharmaceutical introduced into the body. Computed tomography (CT) directs multiple narrow beams of x-rays around a body structure to produce thin, cross-sectional views of anatomical layers (or slices) of the body. The PET scan is highly sensitive to metabolic activity of the tumor while CT provides a detailed internal picture of the size, shape, and location of the tumor. PET, alone, has a definite limitation with respect to spatial resolution and physiological uptake of the radiopharmaceutical tracer, in some areas, can be underestimated or misinterpreted without accurate, anatomical correlations. Scanners that concurrently utilize PET with CT imaging correct for this limitation of PET, by fusing the data for precise anatomical location together with highly sensitive metabolic imaging.
